

We encourage the children to look, listen, ask questions "why?" "what if?".

We use their natural curiosity and interests to the full. As part of the new National Curriculum 2014 the children learn about plants and animals life cycles and science in the world around us through experimenting and trying things out. The new curriculum for Science puts a greater focus on acquiring scientific knowledge, and less emphasis on developing scientific skills and understanding. The children will be involved in experiments, observations and discussing what they have found out. Standards in science are in line with national expectations.
